

Moments on Netflix

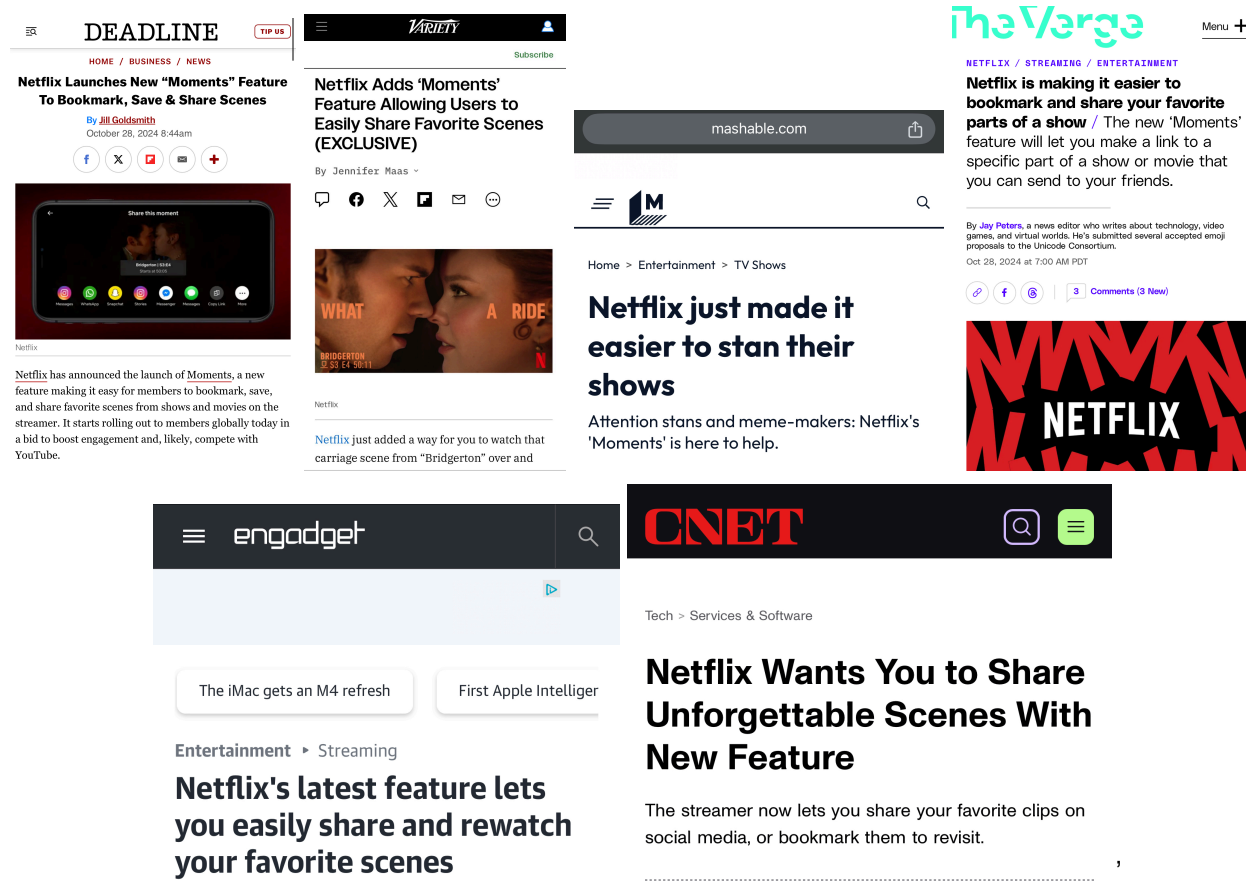

When I first joined Netflix, my primary focus was updating and expanding the mobile footprint and experience for the streaming service, including exploring opportunities for utilizing Netflix content for social connection. I was the sole Content Designer on this product and led competitive analysis, research frameworks, naming, content experimentation, prototyping, and all product content for the end-to-end experience.

The competitive analysis I ran helped us better understand the types of streaming content people liked to view and share across social media, whether coming from netflix or elsewhere. We learned that Instagram, Facebook, TikTok and other social apps were full of short-form clips of people's favorite moments from TV shows and movies.

Often, this content was self-recorded, using a phone camera to record a clip directly off a television, laptop, or tablet. We even discovered entire social accounts dedicated to creating and supplying the internet with Netflix-specific clips.

This analysis and several rounds of UX research I helped lead resulted in us developing the first prototypes, and eventually MVP, for clipping and sharing content directly on Netflix. We called these clips "Moments" to reflect the passion of our members, and the connection a shared moment can bring. This project led to shares across 1000s of different shows and movies, and spawned a new vision for our mobile product, focusing on short-form content, user generated content, and a vertical video feed- all concepts brand new to Netflix.
