

Real-Time Voting

Knowing engagement rates on the top competition shows (American Idol, America's Got Talent, Love Island, etc), max out at 8-10%, we set out to build an interaction system for Netflix that was so easy anyone could use it. I was the sole Content Designer on this product and led life-cycle strategy, information architecture, naming, content experimentation, production scripting, contingency messaging, and all product content for the end-to-end experience.

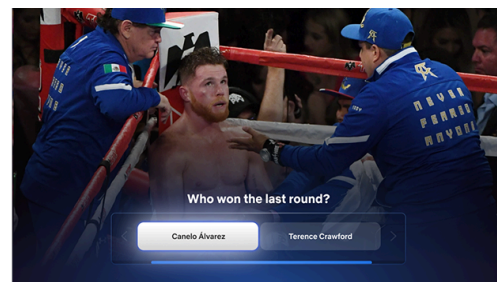

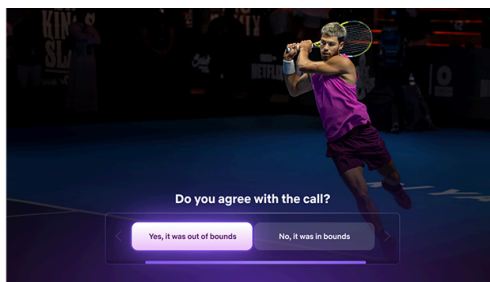

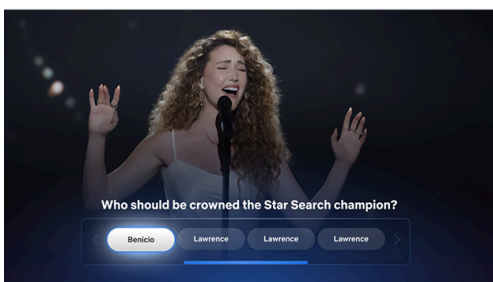

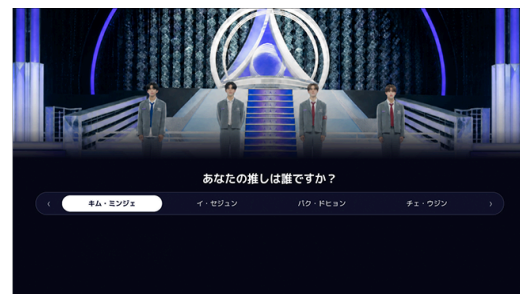

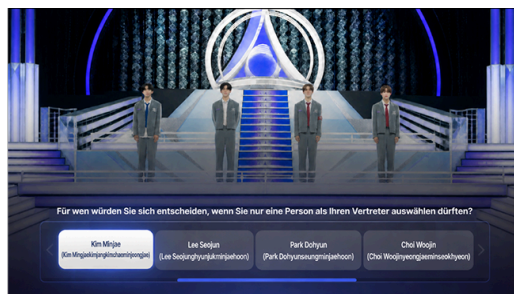

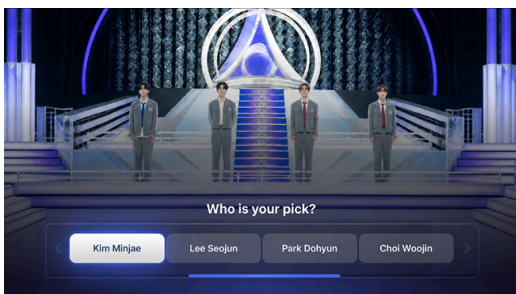

A primary differentiator for us was giving members direct control over interactions and voting, meaning they could simply pick up their TV remote to engage. That felt easy enough conceptually, but in user research we discovered people often misplaced their remotes and weren't ready or prepared to vote when the moment came.

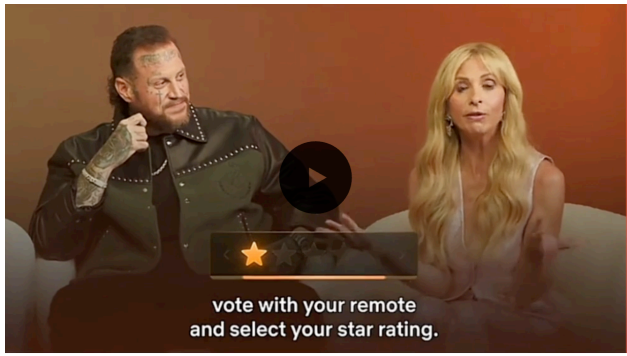

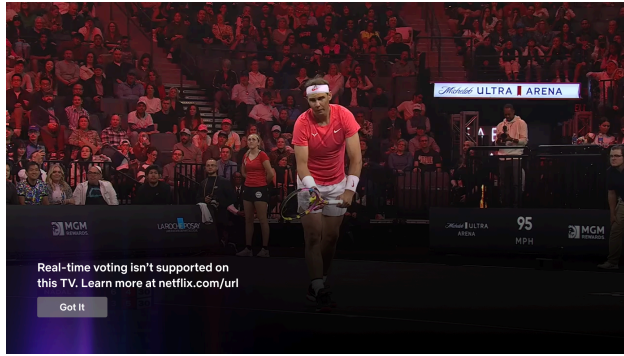

To solve for this, I developed what we called the Voting UI-Lifecycle, which established a sequence of messaging moments, member needs addressed in those moments, and a framework for making live interactions more extensible.

Lead-in	Interactive Window					Payoff
	Open	Interaction	Crescendo	Confirmation	Close	
- Context and Anticipatory mentions “Grab your remote!” style messaging - Unsupported device messaging	- Interactive UI appears “Voting is now open.” or “Vote now” type messaging	- Timed interaction period - Different interactions possible here	- Ending-soon messaging, animation or other signal - Timer UI updates to signal urgency	- Confirming the interaction is complete - TV only: whatever is in focus is selected “Your vote was cast!”	- Interaction time ends “Voting is closed.”	Results shown

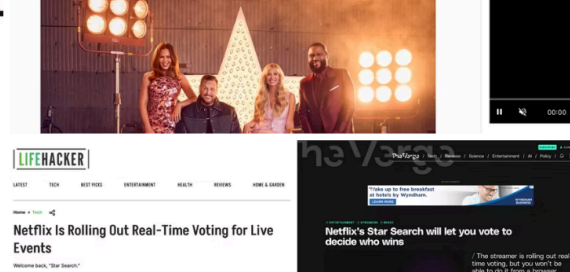

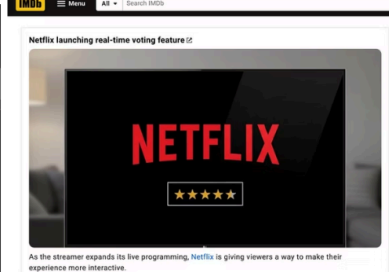

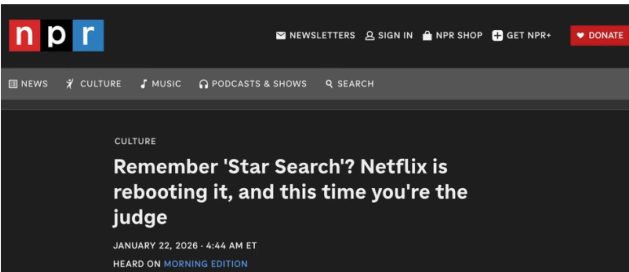

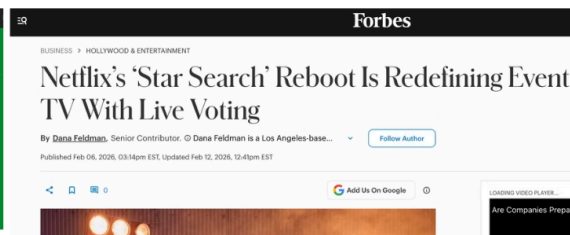

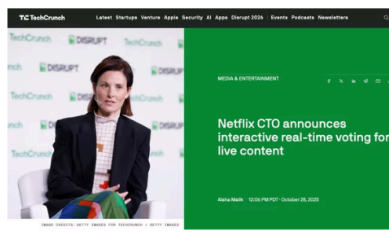

This UI-Lifecycle was referenced throughout our design process, shared with content partners and leadership, and led to the overall structure of our interactive UI, allowing for the same essential moments throughout, regardless of content type, language, or type of interaction.

I led naming of the product experience, real-time voting, and the product content itself, including pre-voting prompts, voting UI, success messaging, promotional content and even the scripts for talent to match our product experience within promo videos, help content, and during live TV.

This meant not only delivering content design specs, contingency messaging specs, and scripts, but physically being on set, working with producers and talent to ensure the show's messaging matched the product and we maximized engagement wherever possible.

The end result was an average 86% interaction engagement rate across content we added real-time voting to, making it not only a massive success for Netflix, but an unprecedented, record-setting experience across the world of television.
